From Approval to Publication

Job Posting Governance in Ontario

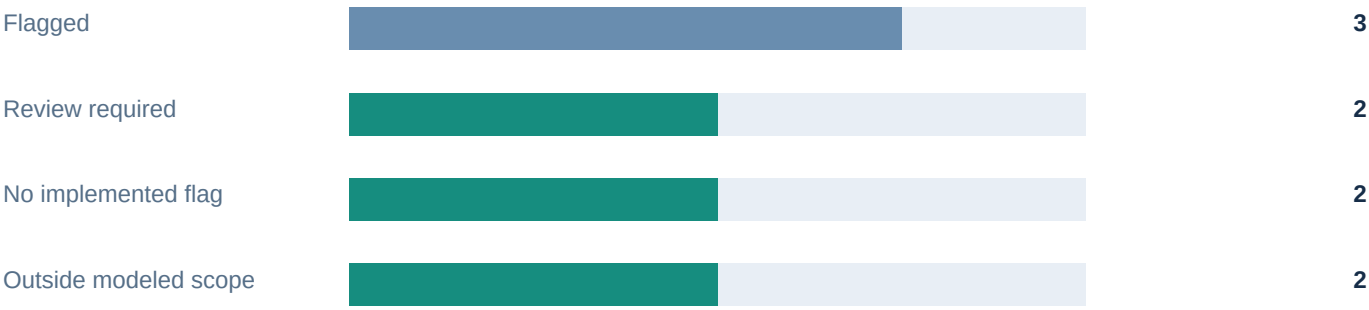

Manvir Singh Judge | HR Operations - HRIS - People Analytics

9	3	2
version snapshots	flagged versions	review required

Approval workflows usually document the template that passed review. Candidates encounter the version that was actually published. I tested whether a version-aware control could expose the gap between those two states while retaining uncertain cases for human assessment. The unit of evidence is the posting version, not simply the requisition ID.

Primary finding

Mutually exclusive disposition counts; synthetic fixtures

JOB-001 v2 introduces two regressions after an unflagged v1

The nine fixtures produce three flagged versions and two review-required versions. JOB-001 moves from no implemented flags in v1 to AI-disclosure and posting-archive flags in v2. That demonstrates a failure mode a template-only check can miss. These outcomes are deliberately constructed test cases, not estimates of employer non-compliance.

Evidence status: all operational data and financial assumptions are synthetic. The figures below are model/fixture results, not client outcomes.

From an HR decision to a defensible metric

The operational owner is TA operations, supported by an HR governance reviewer. Selected Ontario posting requirements effective in 2026 motivate the control design. Coverage, exceptions and compensation interpretation still require knowledgeable human review. The prototype evaluates structured facts; it does not scrape job boards or classify free text.

01 / Evidence intake
Capture posting ID, version, posting date, coverage facts, compensation fields and disclosure/archive facts. Validate identity and date inputs before rule evaluation.

02 / Rule evaluation
Apply the research rule set to structured facts and return distinct flag, review-required, outside-scope and no-implemented-flag outcomes. Unknown or unsupported evidence is not converted to a pass.

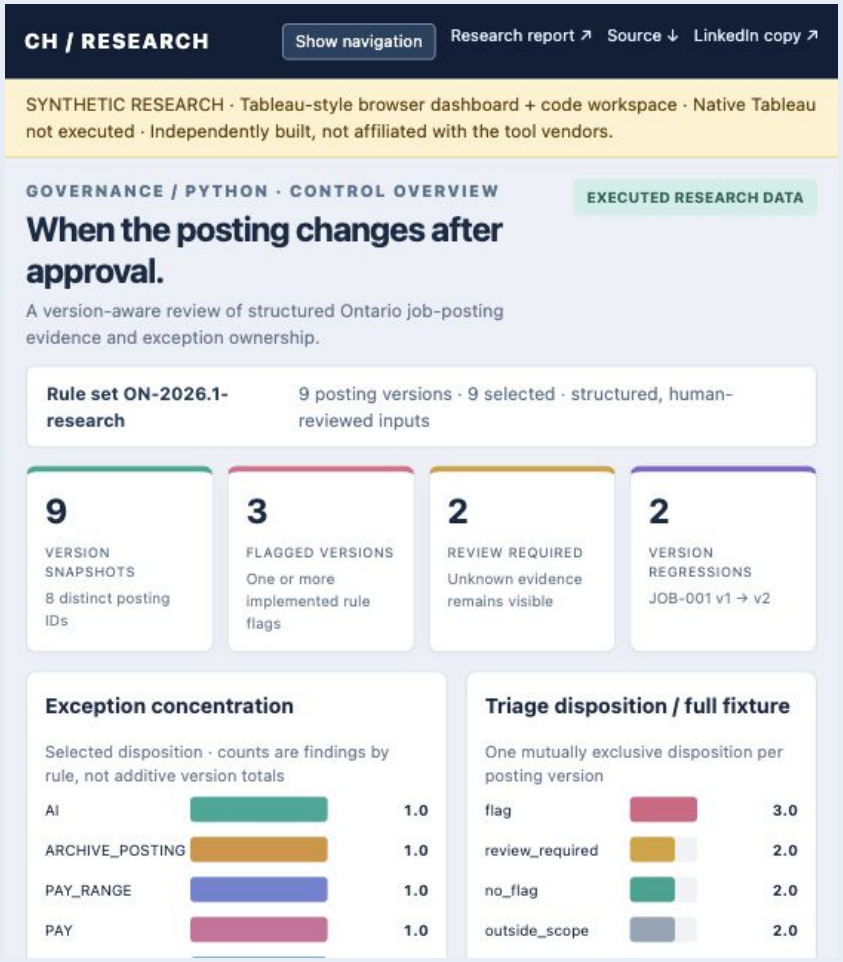

03 / Version comparison
Compare newly introduced findings between approved and later versions. Store a SHA-256 digest of normalized structured facts with the rule version to make the result traceable.

04 / Separate clocks
Posting coverage, interview notification and retention are distinct checks. The interview example has a last qualifying interview on 1 August and a modeled deadline of 15 September; evaluation on 16 September is overdue.

Metric / construct	Definition / interpretation
Version snapshot	Posting ID + version; 9 snapshots / 8 IDs
Flagged version	At least one flag in implemented checks
Review required	Coverage or input facts need human resolution
Regression	New finding relative to a prior posting version
Evidence digest	Hash of structured facts; not proof of page archiving

Reproducibility: the independent project package contains source, frozen synthetic inputs, a verification entry point, dashboard data and the report. Run **python3 verify.py** from the project root.

Management view: route exceptions without hiding uncertainty

01 / Triage grain

The dashboard counts versions once for disposition. Rule-level exception counts can overlap within a version and must not be summed as version totals.

02 / Candidate-facing change

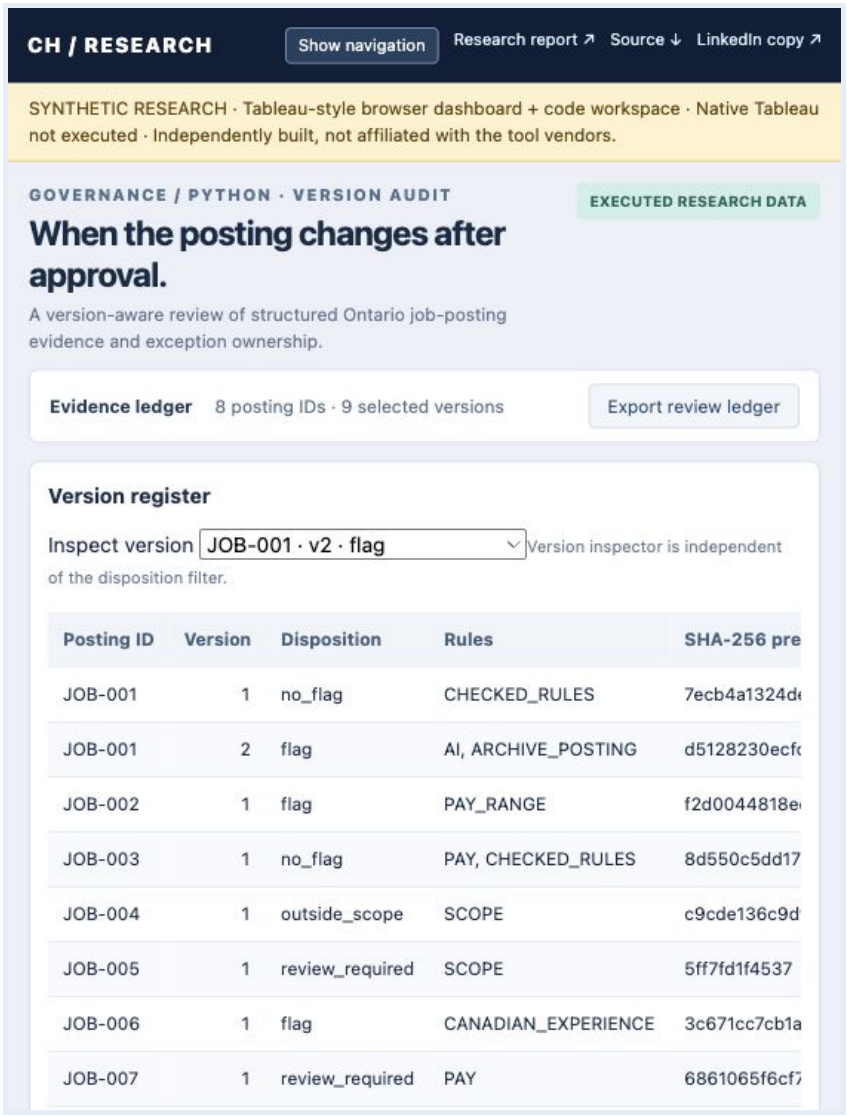

The two regressions in JOB-001 v2 are shown beside the v1 state. This ties the review to publication evidence rather than an earlier template approval.

03 / Interview clock

The notification fixture is separate from the posting-version register. An older posting does not by itself answer the interview timing question.

Figure 1. Actual viewport capture of the working browser implementation. The scrollable dashboard contains the full charts, grids and source panes. Tool resemblance is a presentation convention; native execution is not implied. Full-size images and captions are in the screenshot gallery.

Technical view: inspect the actual version evidence

01 / Source facts

Select a version to inspect its structured input, identified by posting ID and version. No real candidate or employee records are present.

02 / Rule lineage

Each finding carries a rule code, disposition and explanation. The content digest and rule-set version support reproducible comparisons.

03 / Tool provenance

The Tableau-style dashboard and code workspace are browser replicas. The review engine and its verification run are actual Python execution.

Figure 2. Actual viewport capture of the working browser implementation. The scrollable dashboard contains the full charts, grids and source panes. Tool resemblance is a presentation convention; native execution is not implied. Full-size images and captions are in the screenshot gallery.

What the evidence supports

Fixture outcome	Count	Meaning
Flagged versions	3	At least one modeled issue
Review-required versions	2	Unknown / unsupported facts
No implemented flags	2	Not a compliance certificate
Outside modeled scope	2	Scope/date branch
JOB-001 regressions	2	AI + posting archive

Validation and execution provenance

Evidence check	Result / boundary
Reproduce version findings	All 9 findings objects match source output
Regression comparison	AI + ARCHIVE_POSTING identified
Malformed date	Routes to review-required
Boundary coverage	Original suite tests scope/pay/date cases
Native Tableau / editor	Browser replica; Python executed in terminal

Limits of inference. The fixture set is small, synthetic and intentionally enriched for boundary cases. It cannot estimate incidence, false-positive rate or real-world control effectiveness. A hash of facts does not preserve candidate-facing content. Notification grouping is caller-owned. This system neither makes employment decisions nor issues a legal compliance certificate. The current legal consolidation must be reviewed before any deployment.

Recommended next study. Use the prototype to define an evidence-control workflow: named exception owner, source-document retention, reviewer disposition, and a change trigger when a public version differs from the approved one. Validate rules with the appropriate HR/legal reviewer and measure queue resolution and repeat exceptions in a controlled trial.

Sources and research basis

Ontario: publicly advertised job-posting requirements

Ontario: O. Reg. 476/24, consolidated rules

Ontario: Employment Standards Act, Part III.1

Public sources establish context or method; they do not supply the simulated microdata. Ontario indexed official text was rechecked on 20 October 2026; the other sources were reviewed for the original research baseline. Full provenance is in SOURCES.md.
